

Application:

M-Color v9.6 is now available for the Autodesk 2010 family

M-Color v9.6 has now been released and is available, free of charge, to all those on the M-Color Subscription Program.

Apart from working on the Autodesk 2010 family of products, v9.6 also runs on earlier supported version of AutoCAD i.e. 2007, 2008 & 2009. M-Color has always managed to keep one step ahead of AutoCAD in its ability to bridge the gap between traditional CAD and presentation graphics.

M-Color v9.6 offers the following improvements on earlier releases:

Hand-drawing effect - A hand-drawn look adds a touch of personality to your drawings. You can use different effects (curve, deviate, move ends, break and vary width, multiple line segments) to make the drawing look like it was hand-drawn. This is an excellent feature for use in casting initial sketches from your designs.

One-click drop shadows - Adding drop shadows to text or graphics gives depth and flair to your layout. You can create drop shadows simply with the click of a button, then easily adjust the angle, distance, and feathering of the shadow.

Translucent raster images, bitmap textures, and gradient fills - You can make raster images partially transparent so that the background still shows through. You can use the same effect also for bitmap texture fillings and gradient fills. For example, imagine the possibilities of a gradient fill transitioning gradually towards transparency.

Smooth blending of raster images into the background - All transparent raster images are now smoothly blended into the background. With the new 8 bit alpha channel support you can add photos of trees, people, etc. that blend into your drawing perfectly.

Application: *M-Color v9.6 is now available for the Autodesk 2010 family.....continued*

Improved rendering quality and more powerful handling of translucency effects - The rendering mechanism of M-Color has been completely renewed. As a result, the on-screen graphics are smooth and exact. Also, the previewing responds much more rapidly than before, especially when you have used translucent effects.

Faster, higher-quality bitmap exporting - The new technology of M-Color 9.6 enables you to export your drawing as a raster image in just a fraction of the time used by previous versions of M-Color. In addition, the quality of the resulting image is enhanced.

50% smaller PDF files and support for PDF 1.5, including layer data - With M-Color 9.6, you can generate small, high-quality PDF files. M-Color 9 also supports PDF 1.5, including inclusion of your CFG layer information in the resulting PDF file.

Other Improvements - M-Color 9.6 supports hyperlinks in PDF files. Also, you can now also save CFG and PAL files into old formats and activate your M-Color license instantly online. Another improvement providing flexibility is the integration with the AutoCAD paper frame in Paper Space. For automated usage of the software, APIs for bitmap exporting and CFG and PAL manipulation are included in the program.

Dosch Images available under M-Color Subscription

Effective architectural visualization needs people, plants and objects to demonstrate the relevant dimensions and proportions, and also to add realism.

If you have a current M-Color Subscription contract, then you have free access to the library of Dosch images of trees, plants and people.

Dosch Image products are a simple but effective solution to make your M-Color drawings even more realistic and colourful than before.

With M-Color 8.0 and above you can add trees, plants, people and other bitmap images to your architectural elevation drawings and make the background of those bitmaps transparent. The images blend into their respective background and surrounding beautifully and naturally - they become part of the overall scene and don't look artificial or super-imposed.

With the help of the image collections from Dosch Images you can drastically improve your M-Color presentation drawings.
